

Two Pillars of Asset Pricing

Lecture for the Sveriges Riksbank Prize in Economic Sciences in Memory of Alfred Nobel

Eugene F. Fama

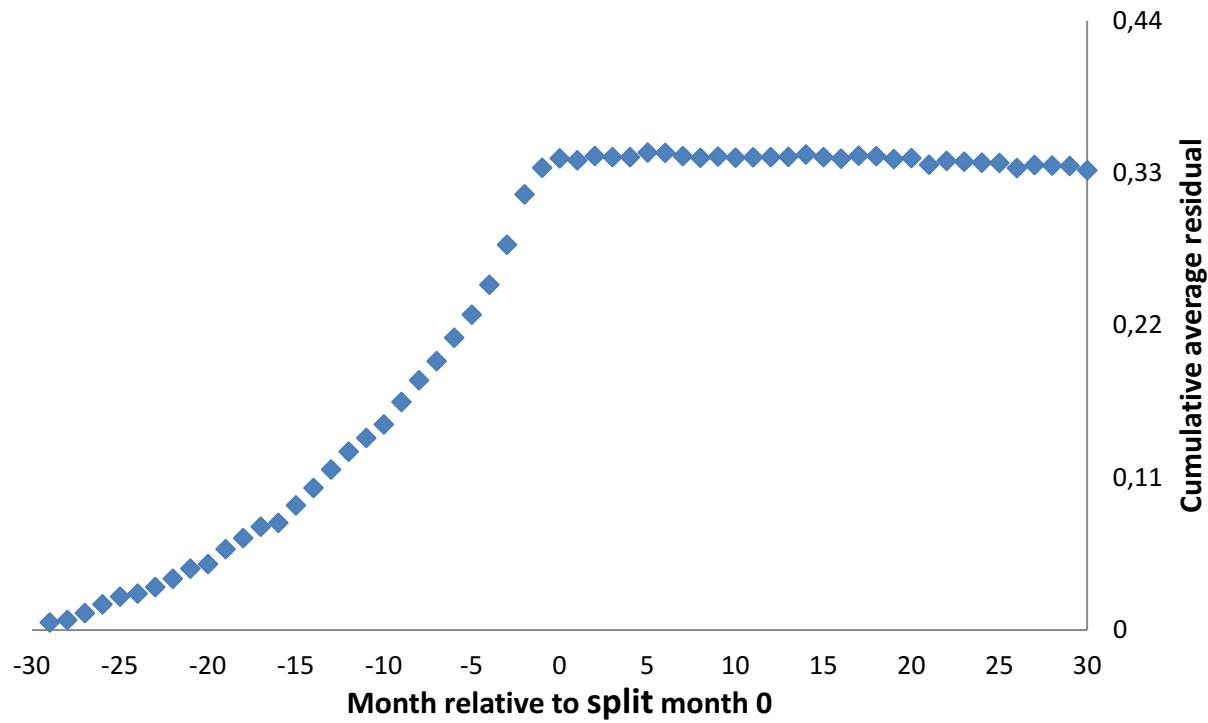

Efficient Capital Markets

A. Early Work

B. Event Studies

$$R_{it} = a_i + b_i R_{Mt} + e_{it}$$

Figure 1 - Cumulative average residuals in the months surrounding a split

C. Predictive Regressions

$$i_{t+1} = E_t(r_{t+1}) + E_t(\pi_{t+1})$$

$$\pi_{t+1} = a + bi_{t+1} + \varepsilon_t$$

D. Time-Varying Expected Stock Returns

$$R_t = a + bD/P_{t-1} + e_{it}$$

E. “Bubbles”

Asset Pricing Models

A. Fama and MacBeth (1973)

$$R_{it} = a_t + a_{1t}b_i + a_{2t}MC_{i,t-1} + a_{3t}B/M_{i,t-1} + e_{it}$$

B. The Fatal Problems of the CAPM

The Three-Factor Model

$$\mathbb{E}(R_{it}) - R_{Ft} = b_i[\mathbb{E}(R_{Mt}) - R_{Ft}] + s_i\mathbb{E}(SMB_t) + h_i\mathbb{E}(HML_t)$$

The regression used to test the model is,

$$R_{it} - R_{Ft} = a_i + b_i(R_{Mt} - R_{Ft}) + s_iSMB_t + h_iHML_t + e_{it}$$

Conclusions
